Feasibility Document

Spring 2026

BookMyManzil

Date: 09/02/2026

Prepared by:
Tehsin Shaik 100064806

Prepared For: Khalifa University

Project Scope

BookMyManzil is a smart, AI-Driven hotel booking and guest experience management system designed within the UAE, initially targeting a small-scale deployment involving a limited number of hotels across the emirates, with planned scalability for future expansion. The system is intended to support essential hotel operations, including room search and booking, real-time availability management, digital check-in /check-out processes, guest service request handling (such as housekeeping and room service), and secure user account management with role-based access for guests, staff, and administrators. In addition to these functionalities, BookMyManzil integrates selected AI-driven features, including a conversational virtual assistant that enables natural language interaction and basic modules that support demand forecasting and pricing recommendations based on historical booking trends. The primary objective of the project is to improve operational efficiency and enhance guest satisfaction through intelligent automation and responsive system behavior, while also demonstrating the practical application of software engineering principles. To ensure feasibility within the project's fixed timeline and limited resources, advanced, large-scale integrations features such as adding and managing additional hotels beyond the scope defined for this project, third-party channel synchronization with external booking platforms, smart hotel infrastructure (for eg: ID-based room access and elevator systems), regional payment providers, parking reservations, and detailed non-room inventory management are explicitly considered out of scope. The final deliverable is a well-structured, modular system prototype that aligns with real-world hotel management needs while remaining achievable within the project's fixed timeline and resource limitations.

Stakeholder Analysis

Hotel guests are the main stakeholders of our project. They require user-friendly software that will allow them to search for the best option, make reservations, digitally check-in/check-out, request additional services and get personalized AI recommendations and advice. Main users of our platform expect strong protection of their personal and payment data and a variety of options to choose from.

Tour companies and travel agencies will use our software to check availability and pricing, make reservations for their clients and manage any unexpected changes. They expect easy communication and support for group bookings.

Technical staff are responsible for updates and enhancements, error resolution and security of the system. They require stable architecture and ease of maintenance. Reception staff need our software to check-in/check-out the guests, manage their inquiries and verify bookings. An efficient system that reduces paperwork and operational errors with an easy-to-learn interface is essential for the front desk staff. Service staff will use the system to receive and manage requests from guests. Timely notifications and a prioritized task list are their top requirements. Hotel managers oversee hotel performance, make operational decisions and analyze reports, expecting from our software reliable analytics on revenue and occupancy together with AI-driven demand forecasting and pricing recommendations.

Market Analysis

The hospitality industry is a highly competitive and customer-centric market in which hotels increasingly rely on digital systems to manage operations and enhance guest experience. While the market for hotel management and booking systems continues to grow, many existing solutions remain limited in terms of personalization, intelligent decision support, and seamless integration between guests and hotel staff. Despite strong competition, demand for advanced and intelligent digital solutions continues to increase. Most hotel management systems provide core functionality such as reservation handling, room availability management, check-in/check-out processes, and basic reporting. However, advanced capabilities such as deep AI integration, real-time personalization, and predictive analytics are often absent or offered only as isolated add-ons rather than fully integrated system features.

Online booking platforms such as Booking.com focus primarily on the guest side of the booking process, offering search, price comparison, and reservation services. While these platforms may include conversational AI for customer support or trip planning, they are not designed to support internal hotel operations, staff workflows, or AI-driven pricing and demand forecasting. As a result, hotels using such platforms still require separate systems to manage daily operations.

On the other end of the market, enterprise property management systems such as Oracle Opera PMS provide comprehensive internal hotel management capabilities, including reservations, billing, reporting, and digital check-in/check-out. However, these systems are often complex, costly, and less flexible, making them less suitable for small and mid-sized hotels. In addition, AI-driven personalization and predictive analytics are limited or not a core focus.

For small and mid-sized hotels looking for simpler alternatives to enterprise systems, cloud-based platforms such as Cloudbeds provide booking and channel management with basic analytics. Although these solutions improve accessibility and reduce complexity, they generally offer weak AI integration, limited advanced analytics, and minimal personalization for guests and hotel staff.

Despite the wide range of available solutions, a clear market gap remains. Existing systems often lack conversational AI assistants, reliable demand forecasting and dynamic pricing, integrated guest–staff communication, and actionable analytics that improve guest experience and operational efficiency.

BookMyManzil is strategically positioned to bridge this gap by unifying core hotel management operations with intelligent, AI-driven capabilities in a single, cohesive platform. It integrates booking management, guest services, staff workflows, and analytics to create a connected and data-driven operational environment. Through conversational AI and predictive analytics for demand forecasting and pricing optimization, BookMyManzil enables hotels to move from reactive operations to informed, proactive decision-making. The platform is designed to scale across diverse hotel environments, delivering advanced intelligence and operational efficiency without the complexity or rigidity of traditional enterprise property management systems.

Technical Analysis

BookMyManzil will be implemented as a web-based, cloud-hosted application, enabling guests and hotel staff to access the system through standard web browsers across desktop and mobile devices. No specialized client-side hardware is required beyond common smartphones, tablets, and office computers with internet access. On the server side, the system will be deployed on scalable cloud infrastructure, allowing computing and storage resources to be expanded as the number of hotels and users grows.

The frontend will be developed using HTML, CSS, and JavaScript, with server-rendered templates and a CSS framework such as Bootstrap used for the initial implementation. As the system evolves, React will be integrated to support more dynamic and interactive user interfaces, particularly for dashboards, booking workflows, and service request management. The backend will be implemented using a Python-based framework such as Django, providing built-in user authentication, role-based access control, and secure request handling, and exposing RESTful APIs for frontend interaction and future integrations, including mobile applications or third-party integrations. A relational database management system (PostgreSQL) will store structured and transactional data, including hotels, rooms, users, bookings, and service requests, ensuring data consistency and preventing issues such as double-booking. AI-enhanced features, including a conversational virtual assistant and demand forecasting for dynamic pricing, will be implemented as Python-based services integrated into the backend and designed to operate independently of core booking functionality.

Development will use standard industry tools, including Visual Studio Code, Git and GitHub for version control, and Postman for API testing. The system will be hosted on cloud infrastructure using virtual machines or managed platform services capable of supporting the backend application and database. The hardware, software technologies, and development skills required for BookMyManzil are well established and widely available. By relying on proven web technologies, a relational database, modular AI integration, and standard development tools, the system presents manageable technical risk and is technically feasible.

Financial Analysis

The financial feasibility of BookMyManzil has been evaluated by analyzing development costs, projected revenue streams, and expected return on investment. The primary costs include development manpower, cloud infrastructure, AI service integration, and system maintenance. While development requires an initial upfront investment, recurring operational costs remain relatively low and predictable, enabling BookMyManzil to achieve profitability and sustain long-term financial growth.

Category	Description	Estimated Cost
Development Labor Costs	3 Full-Stack Developers × AED 10000/month × 6 months	~ AED 180,000
Tools & Software Licenses	Open source (React, Node.js/Django)	AED 0
	Open source (PostgreSQL / MySQL)	AED 0

	UI/UX Design Tools (Figma team plan and design tools)	~AED 1,100/year
	DevOps / Version Control (GitHub and CI tools)	~AED 700/year
	Domain & SSL (Domain + security certificates)	~AED 250/year
Cloud Infrastructure & Hosting	Cloud Hosting (Mid-tier AWS/GCP server & DB)	~AED 6,000/year
	Backups/Data Storage (Cloud storage and redundancy)	~AED 2,000/year
AI Services & APIs	Usage costs for a third-party LLM API	~AED 5,000/year
Maintenance & Support	Ongoing support, bug fixes, and incremental improvements	AED 40,000/year
Total Estimated Cost (Year 1)		**AED 235,050**

Table 1: Estimated Development and Operational Costs

BookMyManzil adopts a hybrid revenue model to ensure fair pricing for hotels of different sizes and booking volumes. The platform charges a commission ranging from 10% to 25% per completed booking, depending on hotel size, location, and contractual agreement. This commission covers property listing, access to BookMyManzil's customer base, and marketing exposure. In addition, hotels pay a fixed monthly platform fee for access to the internal management system, which supports reservation management, digital check-in/check-out, service request handling, analytics, and AI-assisted pricing tools.

To estimate expected revenue, conservative and realistic assumptions based on the UAE hospitality market are used. The average room price is assumed to be AED 600 per booking, with an average commission rate of 15%, resulting in approximately AED 90 commission per booking. Each hotel is assumed to generate an average of 20 bookings per month. In addition, hotels are charged a monthly platform access fee of AED 300 for use of the internal staff and management system.

Revenue Source	Estimated Cost
Booking Commissions	~ AED 1800
Platform Access Fee	~AED 300
Total Monthly Revenue per Hotel	**AED 2,100**

Table 2: Estimated Monthly Revenue per Hotel

Revenue growth is achieved through gradual onboarding of hotels and increased booking volume per property, rather than aggressive pricing or unrealistic adoption assumptions.

Year	Number of Hotels	Estimated Annual Revenue (AED)
Year 1	15	~ AED 432,000
Year 2	30	~ AED 864,000
Year 3	50	~AED 1,440,000

Table 3: Projected Revenue Growth

After the initial development phase, major costs are reduced, with ongoing expenses primarily consisting of hosting, AI services, and maintenance, estimated at approximately AED 55,000 per year.

Year	Revenue (AED)	Expenses (AED)	Net Cash Flow (AED)
Year 1	~ AED 432,000	~ AED 235,050	+196,950
Year 2	~ AED 864,000	~ AED 55,000	+809,000
Year 3	~AED 1,440,000	~ AED 55,000	+1,385,000

Table 4: Projected Cash Flow Summary

BookMyManzil is expected to recover its initial investment within the first year of operation. As the platform scales and onboarding increases, revenue grows significantly faster than operational costs, resulting in a strong positive return on investment.

Legal and Regulatory analysis

Intellectual Property Laws: In the UAE, intellectual property laws ensure the protection of original software, digital systems, and creative works. Federal Decree-Law No. (38) of 2021 on Copyrights and Neighbouring Rights protects software source code, databases, system designs, and technical documentation as original works [1]. Under this law, the components developed for BookMyManzil, including its backend logic, user interface design, and system documentation, are legally protected against unauthorized copying or distribution. Third-party libraries, APIs, and datasets used in the system are selected and integrated only when they are properly licensed and comply with their usage terms. Compliance with UAE intellectual property laws helps safeguard the originality of BookMyManzil while preventing violation of external intellectual property rights [2].

Data Privacy and Regulations: Data privacy in the UAE is ensured by Federal Decree-Law No. (45) of 2021 on the Protection of Personal Data (PDPL), which regulates how personal data is collected, processed, stored, and shared [3]. Since BookMyManzil handles personal information such as guest profiles, booking details, and user account data, the system must ensure that data is collected for clear purposes, accessed only by authorized users like the admin, and protected through appropriate security measures. The PDPL also ensures that the processing of data requires the consent of the user and restricts the transfer of personal data outside the UAE unless proper protection is guaranteed [4]. By following these regulations, BookMyManzil supports responsible data handling practices and maintains user trust while following UAE regulations [5].

Risk Assessment

There are potential risks involved with the development of “BookMyManzil” related to operational, technical, time and project management aspects. Assessing the risks at an early stage helps the project team create mitigation strategies in advance and increase the project’s

chances for success.

Potential risks can be divided into high, medium and low, according to the level of damage they may entail. In Table 5 below, high risks are highlighted in red, medium in yellow, and low in green.

Risk	Description	Mitigation strategy
Technical complexity of AI integration	Limited experience with AI technologies and unexpected model behaviour could make creating conversational AI assistant and demand and pricing forecasting models challenging	• Focus AI on specific, clearly defined tasks, such as helping guests or making simple forecasts • Rely on pre-trained models or APIs • Support AI features with traditional rule-based systems as a backup • Do prototyping and testing early
Time constraints	The project has strict deadlines. Delay in one phase will affect other phases. There is no possibility of increasing the duration of the project due to the limited semester duration.	• Follow the schedule • Prioritize core functionalities before AI-features • Allocate buffer time for testing and documentation
Data availability and quality	AI-driven features rely on historical booking and operational data. Lack of realistic or sufficient data may reduce the effectiveness of demand forecasting and personalization.	• Use simulated or publicly available datasets • Clearly document all assumptions related to data usage • Design the system to function correctly even with limited data
Security and privacy	The system will use personal and payment information. Security failures may lead to data breaches, which could lead to legal consequences and reputational damage.	• Implement secure authentication and role-based access control • Avoid storing real payment data; use mock data where possible • Use encryption and other data protection and privacy practices
Usability	Complex and not user-friendly system will not increase effectiveness in the hotel industry. No one will adopt it if it is not easy to use for staff and guests.	• Keep interfaces simple and intuitive • Apply user-centered design principles • Get feedback from potential users early

Testing limitations	Insufficient time and resources may limit testing scenarios.	• Prioritize testing critical functionalities • Prepare clear test cases based on gathered requirements • Document limitations

Table 5: Risk Assessment

Project Schedule

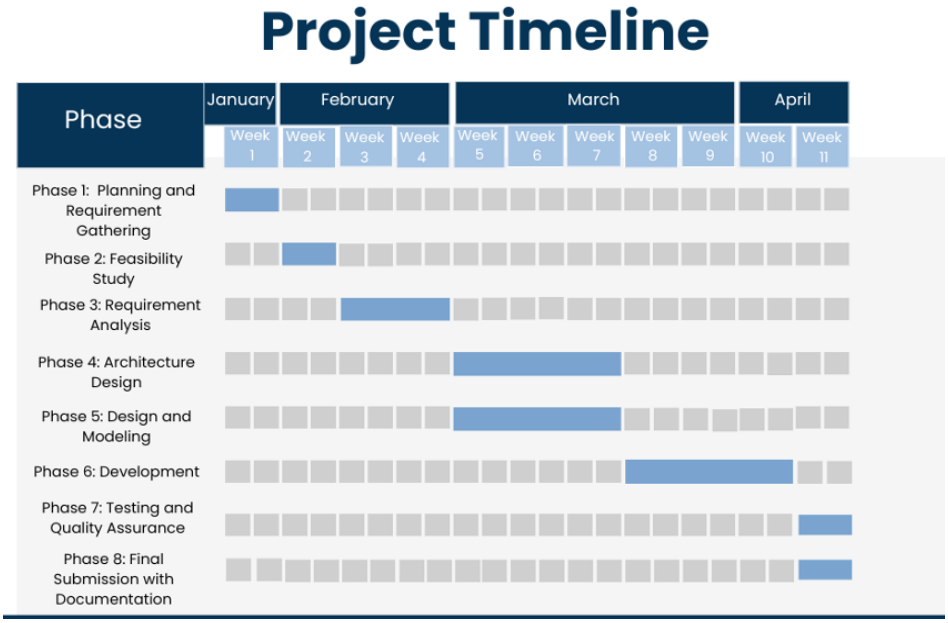

Chart 1: Gantt Chart showing Project Timeline

The BookMyManzil project is planned over an **11-week timeline**, structured into **8 phases** as shown in Chart 1. The schedule begins with planning and requirements gathering, followed by feasibility analysis and detailed requirement analysis. The middle phases focus on architecture design and system modeling, leading into the development phase where core system features are implemented. The project concludes with testing and quality assurance, followed by final submission and documentation. Key milestones include the completion of the system prototype with a demo and the final project submission.

Recommendations

Based on the feasibility analysis, BookMyManzil is a viable and worthwhile investment. The system addresses a clear market gap by combining core hotel management functionality with AI-driven enhancements that improve operational efficiency, pricing decisions, and guest experience. For implementation, a phased action plan is recommended, beginning with the development of core system features, followed by the integration of AI-driven capabilities. The system should then be deployed through an initial controlled rollout to validate performance and usability before expanding adoption as demand and system maturity increase.
